

Comprehensive support and specialized engineering services designed to maximize your success, accelerate team proficiency, and optimize vessel performance using industry-standard CFD simulation.

CORE SERVICE PILLARS

1. CFD Consulting Services

Leverage expert guidance to solve complex hydrodynamic challenges and dramatically reduce vessel fuel consumption.

- **Design Optimization Studies:** Parametric hull form variations and design space exploration.
- **Performance Analysis:** High-fidelity numerical predictions for resistance and propulsion.
- **Research Collaboration:** Specialized joint projects tailored to cutting-edge maritime innovations.

2. Training & Education

Accelerate your team's proficiency and master SHIPFLOW software efficiently through structured programs.

- On-site and remote interactive training modules.
- Customized course content matched to your specific design sector.
- Hands-on workshops and pilot projects using real vessel profiles.

3. Software Customization

Extend the native power of SHIPFLOW with bespoke modifications tailored strictly to your organization's unique workflows.

- **Automation:** Customized pre-processing and streamlined setup.
- **Reporting:** Tailored post-processing scripts and automated report generation templates.
- **Special Features:** Target development for unique company requirements.

4. Dedicated Technical Support

Gain direct, immediate access to assistance provided straight from the core developers and application specialists.

- Priority email support backed by rapid response metrics.
- Live web meetings for real-time model debugging and setup checks.
- Continuous software updates, maintenance patches, and bug fixes.

CONSULTING & SIMULATION SCOPE

FLOWTECH routinely executes high-fidelity CFD simulations utilizing SHIPFLOW's advanced multi-fidelity solvers to evaluate hull forms, scale configurations, and roughness effects:

Hull Form & ESD Optimization	Resistance & Propulsion	Flow, Wake & Seakeeping
Comprehensive optimization of fore bodies for wave resistance, aft bodies for delivered power, and design of energy-saving devices (ESD) in self-propelled conditions.	Rapid evaluation utilizing potential flow (10-120s) and full RANS equations (15-20 min) to predict total resistance, self-propulsion capabilities, and wave patterns.	Industry-renowned exceptional wake accuracy analyzing hull appendages, paired with time-dependent solvers for seakeeping, motions, and wind-assisted performance.

Upfront CAD Integration: Through advanced partnerships (such as with FRIENDSHIP SYSTEMS CAESES®), SHIPFLOW services seamlessly embed into automated CAD parametric workflows, allowing shipbuilders to explore hundreds of design variants effortlessly before production.

Maximize your CFD investment today.
